

Major Network Investment Projects in 2019

Right now we are now well underway with a number of these, including planning for the new Maunu substation build – our first new substation since 2007.

Gearing up to help business grow

We're getting ready for a predicted 25% increase in demand for power in only eight years' time from many of our commercial customers, by upgrading our Kioreroa substation in Whangarei.

This substation powers over 1000 mostly commercial and industrial customers around Port Road and Rewa Rewa Road, including Carter Holt sawmills.

This \$1.5 million investment means we'll be providing a more secure supply to our customers in this area, greatly reducing the risk of future power outages.

We're now 70% of the way through the project – so far we've put in the infrastructure at Kioreroa so we can attach a new line to connect to our supply at Maungatapere and Kensington, lowering the risk of an outage to those customers supplied by Kioreroa substation.

It's another example of the projects we're working on to ensure a reliable power supply to meet our customers' future needs, while improving safety and environmental compliance along the way.

Building a house and need to get connected?

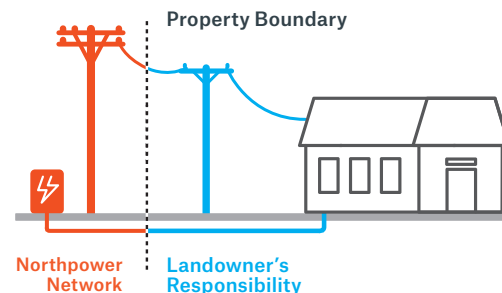

Check out the four-step process on our website at: northpower.com/getconnected.

Here you'll find the information and online application form to get started, along with a list of approved contractors who can help get you live as quickly as possible.

Check your service line

Winter is almost here, so now's a good time to check your service line – the line that runs from our powerlines to your house. It should be clear of any trees to keep you safe and helps reduce power cuts during storms.

We keep trees clear from our network power lines, property owners are responsible for their own service lines. Give us a call and we'll arrange a free disconnect so you can stay safe while maintaining your trees.

ENERGY SAVING TIPS:

Did you know a 90W heated towel rail can cost nearly \$21 a month when running full-time? Fitting a timer could cut that in half and still leave you with toasty dry towels.
